## CLIMATE CRISIS – THE SIMPLE SOLUTION!

The necessary Environmental Revolution we need to save ourselves and the spectacular variety of life on our amazing planet will need to come from us collectively as individuals, simply united in cause, and NOT from the governing greedy elite.

The answer to our needs is simple and freely provided for us to discover. We simply need to learn and understand how we got into this environmental mess and how we can reverse it back to a natural life enhancing balanced system once more.

We breathe in oxygen and we breathe out carbon-di-oxide. Therefore, if we can come up with a natural process to reverse that, we just need to do the same on an industrial scale, to reverse the massive amount of carbon-di-oxide produced by fossil fuel use.

Using a simple home kit to make your own breath carbon neutral does not solve the massive problem we have created. However, it does show each of us how we can solve the problem naturally; it just needs to be scaled up massively. The problem of too much CO<sub>2</sub> in the atmosphere is from an industrialised process, so the answer is to replicate the carbon neutral breath kit on an industrialised scale. SIMPLE!

By using fossil fuel to power our human physical and technological advances we have tampered with the balance of nature. To survive we need to enhance what nature already does for us in the carbon cycle. We need a plant therefore that can physically and safely solve the critical equation for carbon capture by plant means:

Mass x Time x Equivalent Surface(s) of the Earth

One plant fits the bill, a 'Goldilocks' plant for the 'Goldilocks' planet - DUCKWEED.

Duckweed exhibits exponential growth every 48 hours.

1 ton of duckweed on day zero becomes over 32,000,000,000 tons within 70 days!

We put an excess of 36,000,000,000 tons of carbon into the atmosphere annually, more than the natural carbon cycle can cope with. Due to its specific size and habitat, one type of duckweed provides us with the answer. This is why by using your duckweed home kit and understanding what it is doing, we can put pressure on our national governments and world leaders to do the same, but on an industrialised scale.
